POROUS ASPHALT/CONCRETE

The porous asphalt is not installed as a surface aggregate, like regular asphalt. It is installed as a system from the sub-grade, or natural undisturbed ground, up to the asphalt surface. The system works with the specific stone subbase and the local groundwater table, for a usual full depth of 2.5 feet

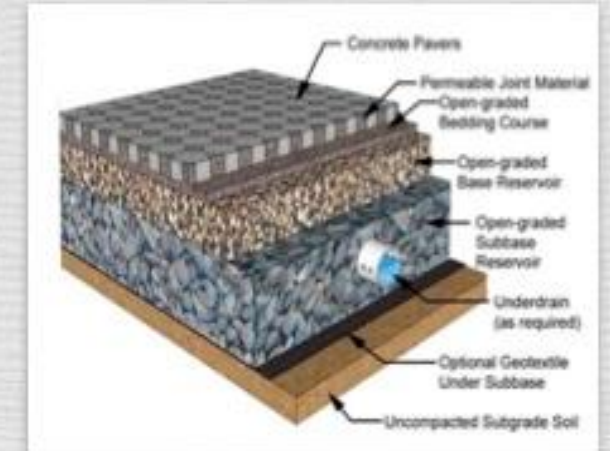

When designing a parking structure for your business, institution, or municipal facility, there are several factors to consider. Immediate cost is always a major consideration, but what about the cost of maintenance years down the line?

While your parking lot may have endured years of patching efforts, The right paving solutions that work to address even the most difficult parking lot problems. We also have the required experience and use only top quality materials – the majority of which are certified. Our suppliers are local and much of the paving products we use incorporate recycled asphalt materials because we believe that going green whenever we can is good for our communities and our environment.

If the existing grade of an area is not right for positive drainage from the surface, how can it be turned into a useable parking surface? For these reasons and more, porous asphalt systems have become an increasingly popular option for new and re-constructed parking surfaces and roadways.

We handle all your excavation site work and drainage system needs. At the same time, we understand the need for cost containment and how to overcome unexpected obstacles that are discovered during and after construction. Our excavation contractors have the equipment and expertise necessary to make all your excavation and grading projects a success.
